

rtkpp: R and stk++ integration using Rcpp

Serge Iovleff

1 Introduction

stk++ is a versatile, fast, reliable and elegant collection of C++ classes for statistics, clustering, linear algebra (using native methods or Lapack), arrays (with an Eigen-like API [1]), regression, dimension reduction, etc. Some functionalities provided by the library are available in the R environment as R functions.

The rtkpp package provides the header files composing the stk++ C++ library (thus users do not need to install stk++ itself in order to use rtkpp), along with implementations of Rcpp::as and Rcpp::wrap for the C++ classes defined in stk++. In this sense it is similar to the RcppEigen [2, 1] and RcppArmadillo [3] packages.

2 Wrapping R data in STK++ arrays

Rcpp facilitates conversion of objects from R to C++ through the templated functions Rcpp::as. The function Rcpp::as is implemented in stk++ but it is not strictly necessary to use it. You can rather use this kind of code

```
Rcpp::NumericMatrix m_data = data; // data is SEXP representing a R-matrix
STK::RcppMatrix<double> mat(m_data); // STK::RcppMatrix<double> mat(data) will work
```

The templated class STK::RcppMatrix wrap the Rcpp matrix (which itself wrap the R SEXP structure). You can access directly (and eventually modify) the R data in your application.

The second templated class you can use is the STK::RcppVector which allow to wrap Rcpp::NumericVector.

3 Converting stk++ arrays and expressions to R data

Rcpp facilitates data conversion from C++ to R through Rcpp::wrap. This function is extended by rtkpp for the stk++ arrays and vectors.

The following example is taken from the STK::ClusterLauncher class

```
Array2D<Real> mean(K, nbVariable), sigma(K, nbVariable);
// get estimated parameters
// ....
// and save them
NumericVector m_mean = Rcpp::wrap(mean);
NumericVector m_sigma = Rcpp::wrap(sigma);
```

Note that the Rcpp::wrap is rather limited in its usage and if you need, for example, to convert expression rather than arrays then you can use the STK::wrap function (see example below).

4 An example

The package countMissings can be downloaded at the www.stkpp.org url. It is basically composed of one R-script file (countNA.R) and one C++ file (countNA.cpp).

Given a R matrix, it is possible to get a list composed of two vectors constaining respectively the number of missing values in each rows and the number of missing values in each columns of the R matrixes.

The R-script countNA.R looks

```
countNA <- function(data)
{
  if (!is.matrix(data)) { stop("in countNA, data must be a matrix.") }
  .Call("countNA", data, PACKAGE = "countMissings")
}
```

and the C++ files looks

```
#include "RTKpp.h"
RcppExport SEXP countNA( SEXP r_matrix)
{
    BEGIN_RCPP
    STK::RcppMatrix<double> m_data(r_matrix);
    // use STK::wrap function (Rcpp::wrap function will not work)
    return Rcpp::List::create( Rcpp::Named("rows")= STK::wrap(STK::countByRow(m_data.isNA()))
                             , Rcpp::Named("cols")= STK::wrap(STK::count(m_data.isNA()))
                             );
    END_RCPP
}
```

5 Using rtkpp in other packages

The only thing to do in your code is to include the header file

```
// Rcpp.h will be include by rtkpp
#include <RTKpp.h>
```

and when compiling your source, to indicate the location of the stk++ library by using `rtkpp::CxxFlags()`, `rtkpp::CppFlags()` and `rtkpp::LdFlags()` in your Makevars.

If you are building a package with a lot of cpp files, you may find convenient to locate your sources in a separate directory. Hereafter we give an example of a Makevars you can modify at your convenience in order to handle this situation.

```
#-----
# Purpose:  Makevars for the R packages using rtkpp (stk++)
#-----
PKGNAME = NAME_OF_YOUR_PACKAGE

PKGDIR    = FULL_PATH_TO_YOUR_PACKAGE
PKGLIBDIR = $(PKGDIR)/lib
PKGLIB    = $(PKGLIBDIR)/lib$(PKGNAME).a

## Use the R_HOME indirection to support installations of multiple R version
## use $(SHLIB_OPENMP_CXXFLAGS) if you want openmp
PKG_CXXFLAGS = `${R_HOME}/bin/Rscript -e "Rcpp::CxxFlags()"` \
               `${R_HOME}/bin/Rscript -e "rtkpp::CxxFlags()"`
PKG_CPPFLAGS = `${R_HOME}/bin/Rscript -e "Rcpp::CxxFlags()"` \
               `${R_HOME}/bin/Rscript -e "rtkpp::CppFlags()"` \
               $(SHLIB_OPENMP_CXXFLAGS)

## use $(LAPACK_LIBS) $(BLAS_LIBS) $(FLIBS) if you want lapack
PKG_LIBS = `${R_HOME}/bin/Rscript -e "Rcpp::LdFlags()"` \
            `${R_HOME}/bin/Rscript -e "rtkpp::LdFlags()"` \
            $(SHLIB_OPENMP_CXXFLAGS) $(LAPACK_LIBS) $(BLAS_LIBS) $(FLIBS)

export

.PHONY: all pkglib

## $(SHLIB) is the usual default target that is built automatically from all source
## files in this directory. pkglib is an additional target for the package
## that will be found in $(PKGDIR).
all: $(SHLIB)
$(SHLIB): pkglib
```

```
## build the PKGLIB (lib$(PKGNAME).a)
pkglib:
(cd $(PKGDIR) && $(MAKE) all)
(cd $(PKGDIR) && $(MAKE) clean)
```
